**CORPORATE PRESENTATION
SEPTEMBER 2026**

TSXV: CGNT

OTCQB: LBCMF

FRA: 29H0

FORWARD LOOKING STATEMENT

Certain statements included in this presentation are forward-looking statements within the meaning of Canadian securities laws, including the following statements: the ability of Copper Giant (or the "Company") to develop resources and then further develop reserves and resources; the anticipated economic potential of the concessions; the availability of capital and finance for the Company to execute its commitments and strategy going forward. Forward-looking statements are based on estimates and assumptions made by the Company in light of its experience and perception of current conditions and expected future developments, as well as other factors that the Company believes are appropriate in the circumstances. Many factors could cause the Company's results, performance or achievements to differ materially from those expressed or implied by the forward looking statements, including: discrepancies between actual and estimated results from exploration and development and operating risks, dependence on early exploration stage concessions; political and foreign risks; uninsurable risks; competition; regulatory restrictions, including environmental regulatory restrictions and liability; currency fluctuations; defective title to mineral claims or property and dependence on key employees. Persons reviewing this presentation are cautioned not to place undue reliance

on forward-looking statements due to inherent uncertainty therein. The Company disclaims any intention or obligation to update or revise any forward-looking statements, whether as a result of new information, future events or otherwise, except as required by law.

The scientific and technical information contained in this presentation has been derived from the National Instrument 43-101 ("NI 43-101") Technical Report, entitled "Technical Report and Updated Mineral Resource Estimate for The Mocoa Project, Putumayo Department, Colombia", dated January 8, 2026, prepared by Michael Dufresne (P.Geo, P.Geol, MSc), Warren Black (MSc, P.Geo), Kevin Hon (BSc, P.Geo) and Chester de Leon (P.Eng), with an effective date of December 23, 2025. The Technical Report can be found under the Company's profile on SEDAR (www.sedarplus.ca) and is also available on the Company's website (www.coppergiant.co). The scientific and technical information contained in this presentation has been reviewed and approved by Edwin Naranjo Sierra, Vice-President of Exploration (MSc and FAusIMM), who is a "Qualified Person" as defined under National Instrument 43-101. Mr. Naranjo is not independent of the company.

TOTAL INFERRED RESOURCES

1. The MRE was completed by Kevin Hon, B. Sc. , P. Geo. , Senior Resource Geologist, and Warren Black, M. Sc. , P. Geo. , Senior Consultant: Mineral Resources and Geostatistics, both of APEX. Mr. Hon and Mr. Black are independent Qualified Persons, as defined by NI 43-101, and are responsible for the completion of the Mineral Resource Estimate, with an effective date of November 18, 2025. Michael Dufresne, M. Sc. , P. Geo. , President & CEO of APEX, completed a peer review of the estimate.

2. Mineral Resources that are not Mineral Reserves do not have demonstrated economic viability.

3. The estimate of Mineral Resources may be materially affected by environmental, permitting, legal, title, taxation, socio-political, marketing, or other relevant issues.

4. The Inferred Mineral Resource in this estimate has a lower level of confidence than that applied to an Indicated Mineral Resource and must not be converted to a Mineral Reserve. It is reasonably expected that the majority of the Inferred Mineral Resource could potentially be upgraded to an Indicated Mineral Resource with continued exploration.

5. The Mineral Resources were estimated in accordance with the Canadian Institute of Mining, Metallurgy and Petroleum (CIM), CIM Standards on Mineral Resources and Reserves, Definitions (2014) and Best Practices Guidelines (2019) prepared by the CIM Standing Committee on Reserve Definitions and adopted by the CIM Council.

6. Economic assumptions used include US\$4. 00/lb Cu, US\$20. 00/lb Mo, process recoveries of 90% for Cu and 95% for Mo, a US\$10/t processing cost, G&A costs of US\$1. 00/t, and a 3% NSR royalty

7. CuEq* values are calculated using a Cu-to-Mo value ratio of 1: 5. 278, incorporating both metal prices and metallurgical recoveries.

8. The constraining pit optimization parameters include a US\$2. 5/t mining cost for both mineralized and waste material and a 45° pit slopes. Pit-constrained Mineral Resources are reported at a cutoff of 0. 25% CuEq*.

*For further information refer to NI 43-101 Technical Report, entitled "Technical Report and Updated Mineral Resource Estimate for The Mocoa Project, Putumayo Department, Colombia", dated January 8, 2026, prepared by Michael Dufresne (P. Geo, P. Geol, MSc), Warren Black (MSc, P. Geo), Kevin Hon (BSc, P. Geo) and Chester deLeon (P. Eng), with an effective date of December 23, 2025.

TSXV: CGNT

OTCQB: LBCMF

FRA: 29H0

NOTES ON DRILL RESULTS

Copper equivalent (CuEq) for drill hole interceptions is calculated as: $\text{CuEq (\%)} = \text{Cu (\%)} + 5.278 \times \text{Mo (\%)}$, utilizing metal prices of Cu - US\$4.00/lb and Mo - US\$20.00/lb and metal recoveries of 90% Cu and 95% Mo. Mineralized zones at Mocoa are bulk porphyry-style zones and drilled widths are interpreted to be very close to true widths.

QUALIFIED PERSON (QP)

Edwin Naranjo Sierra, MSc and FAusIMM, registered with the Australasian Institute of Mining and Metallurgy, is the Qualified Person, as defined by the Canadian Securities National Instrument 43-101 Standard for Disclosure for Mineral Projects, for the Mocoa Cu-Mo porphyry project. Mr. Naranjo Sierra is the Vice-President of Exploration of Copper Giant. He has reviewed and approved the disclosure of the scientific and technical information contained in this presentation. Mr. Naranjo is not independent of the company.

NOTES ON QA/QC PROCEDURES

Copper Giant operates according to a rigorous Quality Assurance and Quality Control (QA/QC) protocol consistent with industry best practices. Core diameter is a mix of HQ and NQ depending on the depth of the drill hole. Diamond drill core boxes were photographed, sawed, sampled and tagged in maximum 2-metre intervals, stopping in geological boundaries. Samples were bagged, tagged and packaged for shipment by truck from Copper Giant's core logging facilities in Mocoa, Colombia to the Actlabs certified sample preparation facility in Medellin, Colombia. ActLabs is an accredited laboratory independent of the company. Samples are processed in the Medellin facilities where they are analyzed for copper and molybdenum by 4-Acid digest Atomic Absorption (AA) analysis. The sample pulps are air freighted from Medellin to the ActLabs certified laboratory in Guadalajara, Mexico, where they are analyzed for a suite of 57 elements using 4-Acid digest and ICP-MS. In order to monitor the ongoing quality of assay data and the database, Copper Giant has implemented QA/QC protocols which include standard sampling methodologies, the insertion of certified copper and molybdenum standard materials, blanks, duplicates (field, preparation and analysis) randomly inserted into the sampling sequence. QA/QC program also include the ongoing monitoring of data entry, QA/QC reporting and data validation. No material QA/QC issues have been identified with respect to sample collection, security and assaying.

The contained metal doubled from 2022 to 2025 MRE update

WHERE MOCOAS METRES CAME FROM

671,000 lb CuEq per metre

Added by the 9,525 m drilled since the 2022 MRE.

Company drilling results. CuEq (%) = Cu (%) + 5.278 × Mo (%), at US\$4.00/lb Cu and US\$20.00/lb Mo with recoveries of 90% Cu and 95% Mo; copper equivalent values are calculated by the Company from the reported grades. Grade × length is the reported grade multiplied by the reported interval length, in percent-metres—a comparative measure of intercept quality only, not a resource or metal-content estimate. The top five are each hole's headline intercept; nested sub-intervals are not listed separately. Single-sample records are the highest individual assays in the Company's database from the 2022–2026 drill programmes, over sample lengths. Individual high-grade samples are selective in nature and are not necessarily representative of the mineralization on the property. See the QA/QC and Technical Notes slide for sampling, analytical in slide 28.

ARQUITECTURE OF A GIANT

THE SHAPE OF A PORPHYRY

PARAGENESIS — WHERE THE METAL ACTUALLY ARRIVES

Schematic vein sequence and phase assignment, after Mocoa core logging

Sections constructed in Leapfrog from the Company's drillhole database with a 100 m section buffer; downhole bars are coloured by CuEq (%) on the scale used for the Mineral Resource Estimate. $\text{CuEq (\%)} = \text{Cu (\%)} + 5.278 \times \text{Mo (\%)}$, at US\$4.00/lb Cu and US\$20.00/lb Mo with recoveries of 90% Cu and 95% Mo.

A KILOMETRE OF COPPER

DRILL HIGHLIGHTS

HOLES OVER A KILOMETRE

Eight of the twenty holes with reported results cross the one kilometre mark

Company drilling results. $\text{CuEq (\%)} = \text{Cu (\%)} + 5.278 \times \text{Mo (\%)}$, using US\$4.00/lb Cu and US\$20.00/lb Mo and metallurgical recoveries of 90% Cu and 95% Mo; copper equivalent values shown are calculated by the Company from the reported Cu and Mo grades. Bars show the reported mineralised interval measured along the hole, drawn to true downhole depth, with the reported higher-grade sub-intervals nested inside at their reported depths. Mineralized zones at Mocoa are bulk porphyry-style and drilled widths are interpreted to be very close to true widths. Refer to the QA/QC and Technical Notes for sampling, analytical in slide 28.
